- **Soil: 10^4 - 10^7 species / gram**
- **Uneven distributed**

- **Terragenome: To sequence and assemble an entire metagenome of soil (Rothamsted, UK).**

Metagenomic approach:

The long-term experimental site in the UK:

Rothamsted <http://www.rothamsted.ac.uk/>

- * Extensive metadata
- * From 50 to 140 years of controlled experiments

A few problems

<u>“Species”/g soil</u>		<u>Number of bp</u>		<u>Number of pyroseq Runs (fosmid clones)</u>
10^4	→	4×10^{10}	→	10^2 (10^6)
10^7	→	4×10^{13}	→	10^5 (10^9)

Total b&a/g soil

Number of bp

Number of runs

10^9

4×10^{15}

10^7 (10^{11})

-Need to create strategies to improve soil nucleic diversity accessibility

-Need to find variables that fraction DNA to access parts of the rare biosphere to limit sequencing redundancy

Searching for genomic diversity

Vertical soil fractionation

Cellular fractionation in a density gradient

Cell lysis stringency

Molecular DNA weight fractionation

Some people think one needs to do composite sampling

Some people sieve soil and technique is everything

Of course this could vary from person to person

Jobs Overview

The overview below list all genomes currently processed and the progress on the annotation. To get a more detailed report on an annotation job, please click on the progress bar graphic in the overview.

In case of questions or problems using this service, please contact: mg-rast@mcs.anl.gov.

Progress bar color key:

-  not started
-  queued for computation
-  in progress
-  load in progress
-  requires user input
-  failed with an error
-  successfully completed

Functional Subsystem Distribution

Is Everything Everywhere?

{ What is everything? Species, genes, function, sequences }
{ Where is everywhere? 1 g; 1kg; 1 ton of soil }

Is Everything Everywhere? Yes:

Soil community “adaptation” is growth or gene rearrangement and/or exchange

Is Everything Everywhere? No:

“Adaptation is *de novo* gene synthesis w/ or w/o gene exchange
(Or microbial movement)

Soil compared to other « environments »

TREE VS Biodiversity

Assembly vs Diversity

CONCLUSIONS

Soil Metagenomics provides access to microbial biodiversity

1. Sequencing helps uncover hidden diversity
 - Sequence interpretation is heavily dependent on genome sequences in database – need more genomes sequenced.
2. Clone libraries provide contiguous sequences
 - Long term possibility of genomic assembly.
3. Definition of sequence and genomic variance affects biodiversity estimates.
